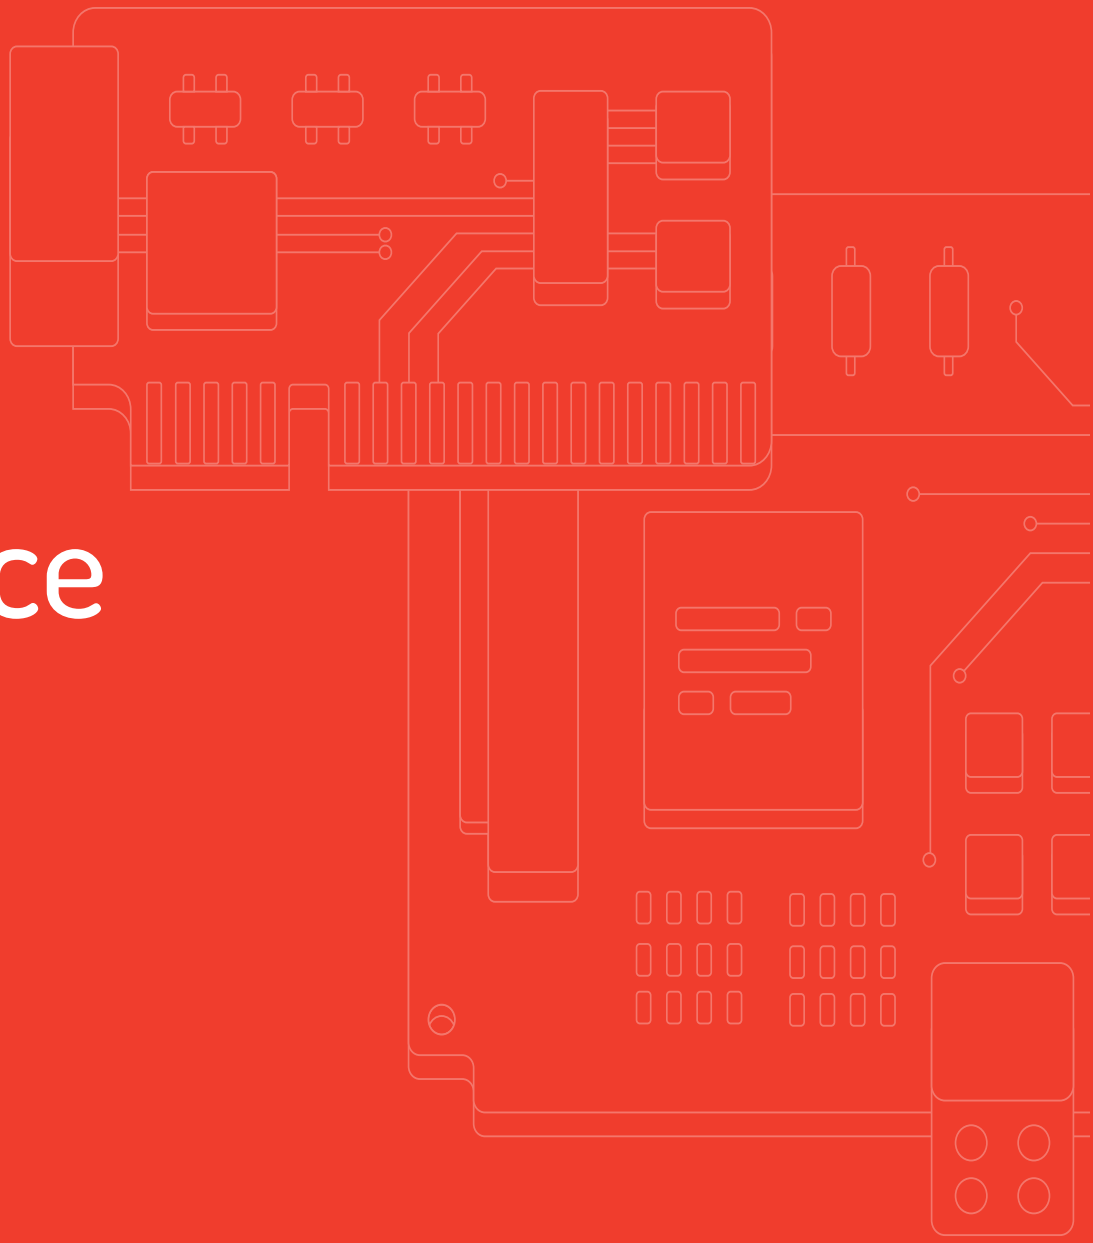
Our experience



Telecoms progress slowly

- Overpriced services
- Little difference in offering between ISPs
- Users are given black boxes with limited functionality
- Time-consuming process of deploying new services

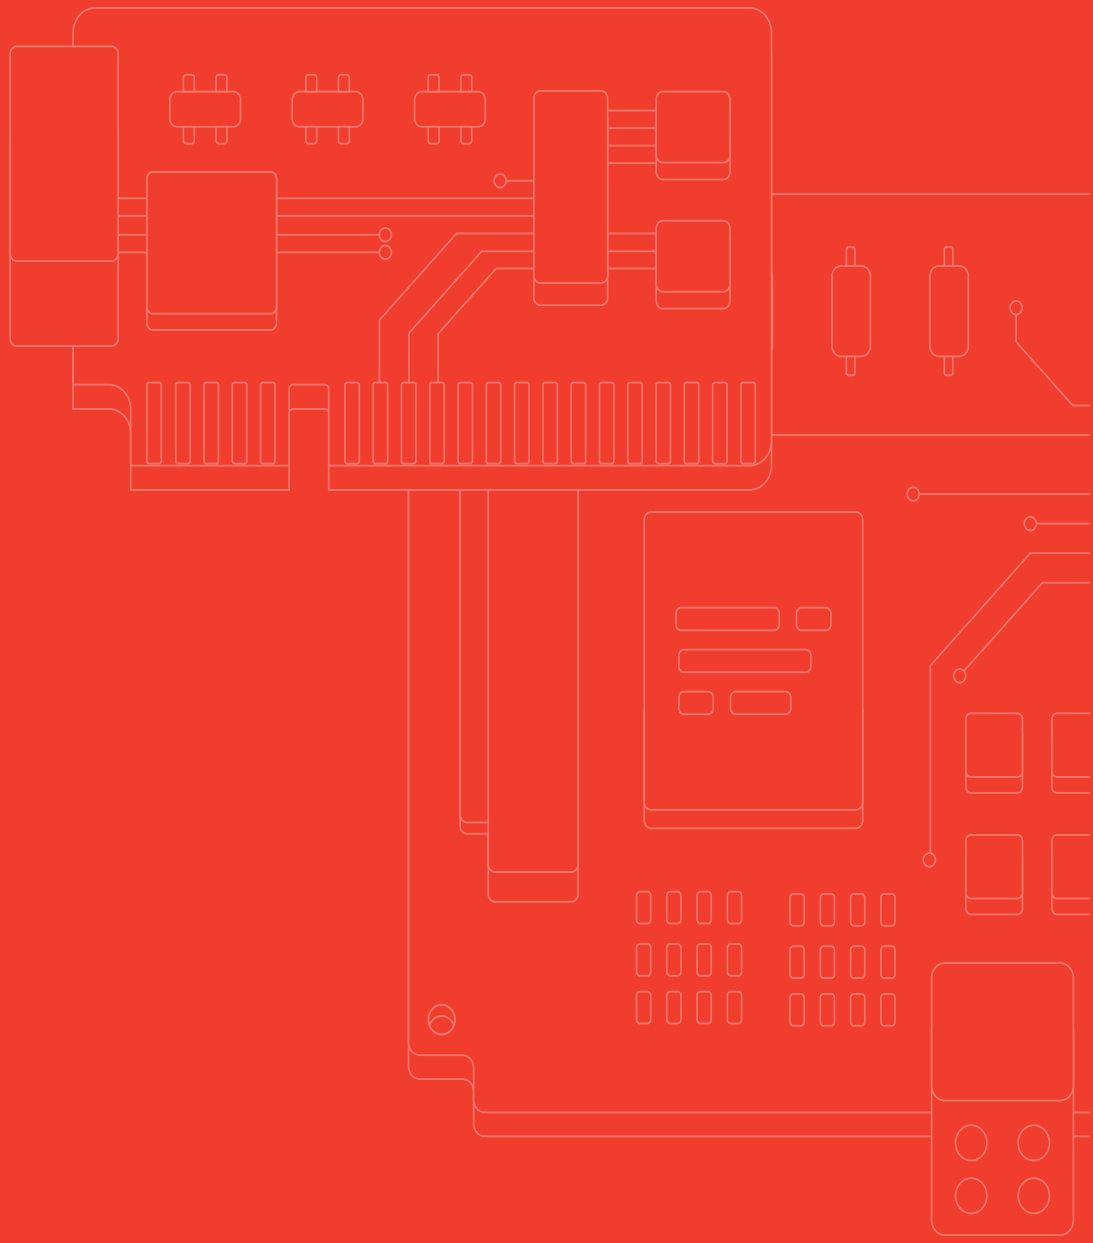
Antiquated software & underperforming hardware

- Market drives equipment quality down
  - Impacts both software and hardware
- Major security vulnerabilities
  - Numerous security exploits over the recent years
  - Growth of IoT introduces more vulnerabilities

Vendor lock-in

- Populated with proprietary, single-purpose platforms
- Software & hardware vendor lock-in
- Limited control over devices and services
- Inability to update & upgrade software

Our vision



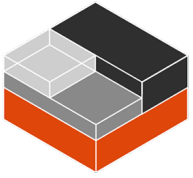
A different approach

- Working on next-gen solutions with partner network
- Complete control over network
  - Bare metal
  - Virtualization

Open Source technologies

- Full control over **all** software
- Latest features and security fixes
- Easy and fast adaptation of new services

OvS Open vSwitch



LXC

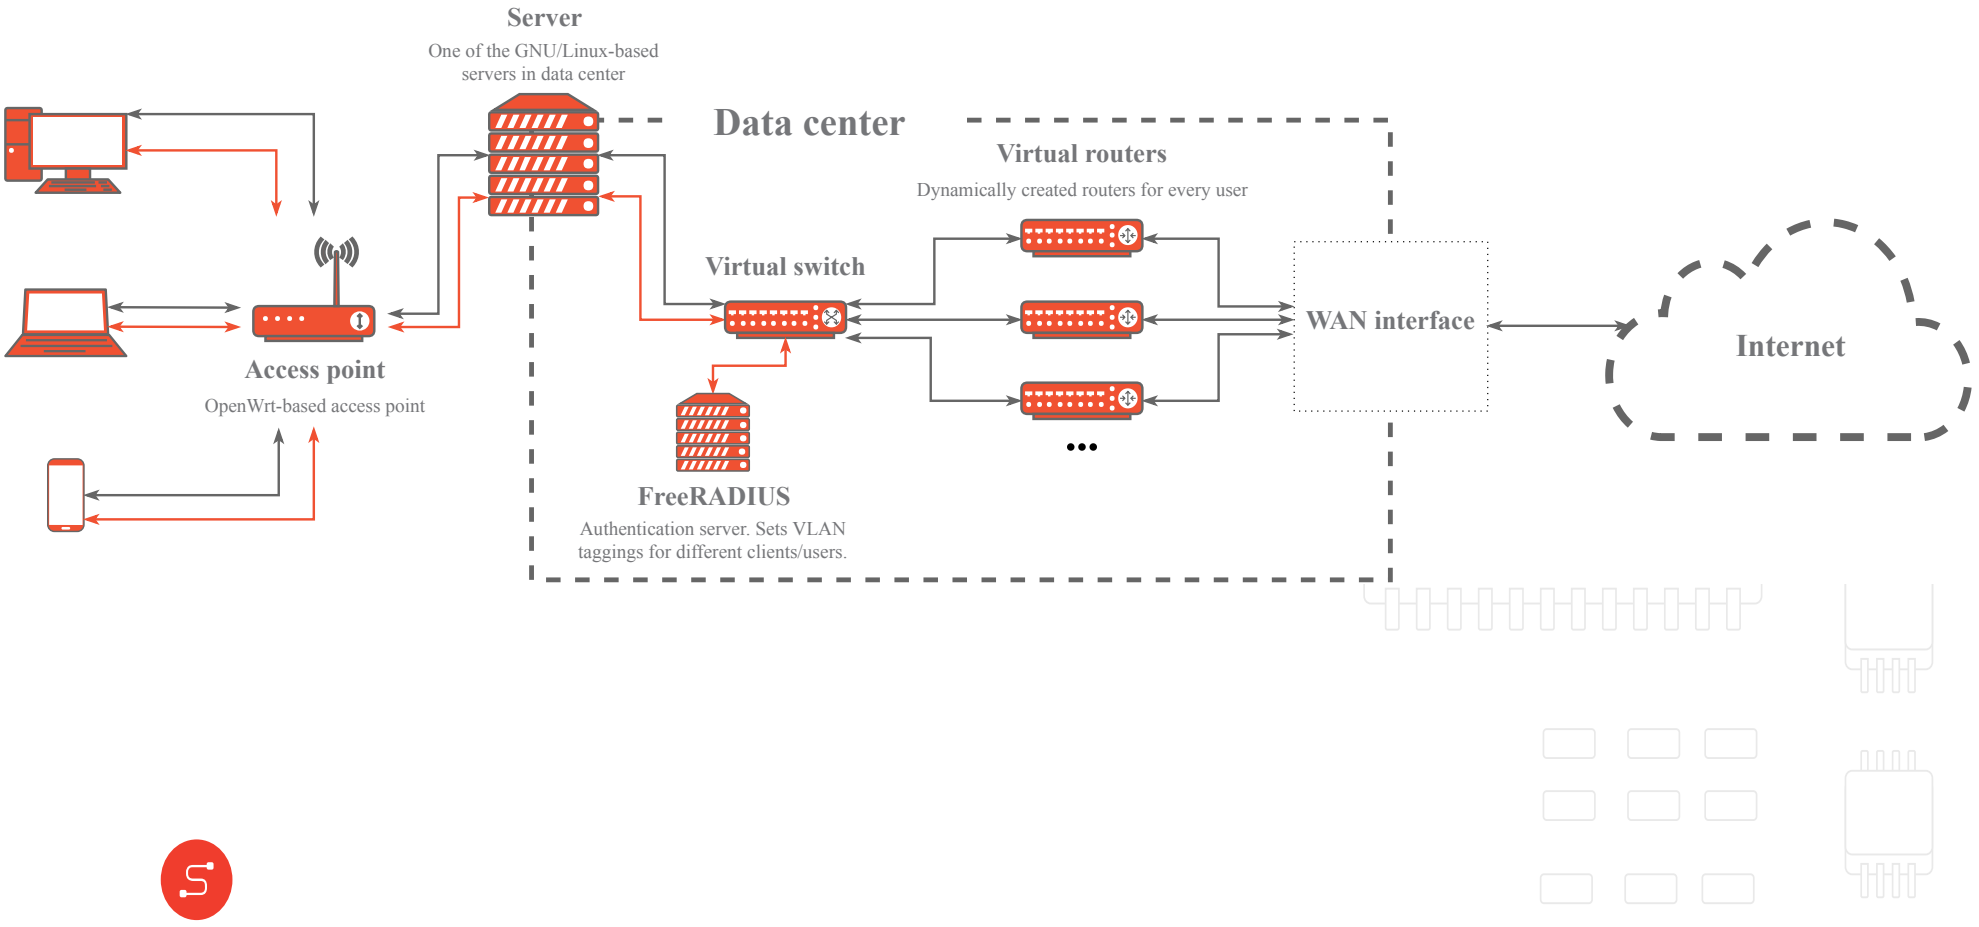
uboot

gentoo linux™

OpenWrt Wireless Freedom

Optimal hardware at every layer

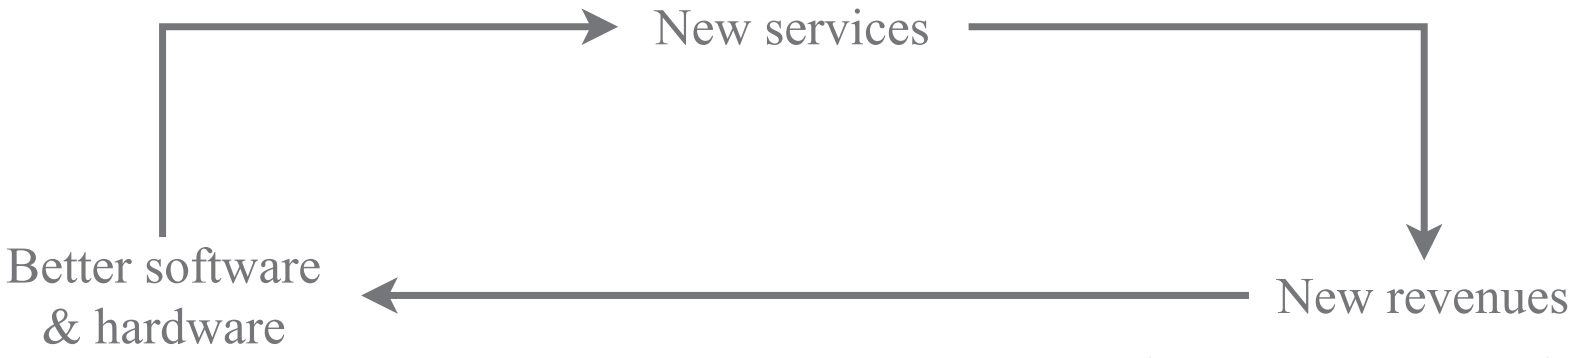
- Collaboration with chipset vendors and OEMs
- Handpicked components from data center to on-field CPEs
- Based on ARM processors with low power consumption
- Reducing both capital and operational costs



Server
One of the GNU/Linux-based servers in data center
Data center
Virtual routers
Dynamically created routers for every user
Virtual switch
WAN interface
Internet
Access point
OpenWrt-based access point
FreeRADIUS
Authentication server. Sets VLAN taggings for different clients/users.

More than just connectivity

- Differentiation by services
- Providing quality and diverse services
  - Entertainment, security, IoT
- Wholesale technology provider
  - Development of custom functionalities



New services
New revenues
Better software
& hardware
